Cement Provides New Advancement in Adhesive Technology

Envy self-etch, self-adhesive cement provides a new advancement in adhesive technology. It is a truly multisurface cement that even solves the problem of adhesion to zirconia. It has been proven to have high retention, not only to zirconia but also enamel, dentin, PFM, lithium disilicate, gold, and many others. Its unique chemistry provides tack curing for easy cleanup. Just light cure for a few seconds and this will allow the cement to become a gel-like material that flakes right off in one clean piece. Envy ensures virtually no post-op sensitivity. You can finally rely on one cement for various types of restorations. To meet various clinical needs, Envy is available in translucent, white, and A2. For more information, call **(201) 487-9090** or visit edsdental.com/envy.
